Example 11.1: node voltage analysis step by step

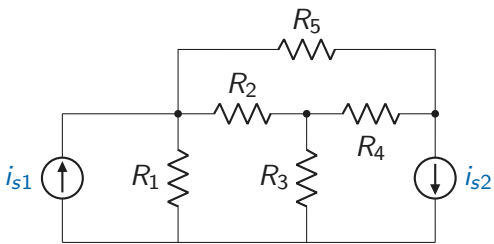

For now: only resistors and independent current sources

Question. How many unknowns?

$b = 7$: 14 unknowns

Example 11.1: node voltage analysis step by step

For now: only resistors and independent current sources

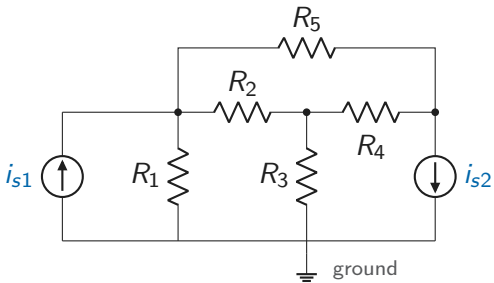

Question. How many unknowns?

$b = 7$: 14 unknowns

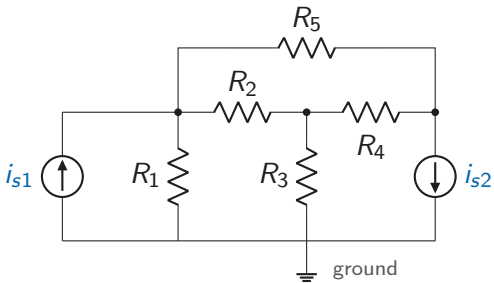

Node voltage analysis: 3

Step 1: choose a reference node

Reference node: the ground

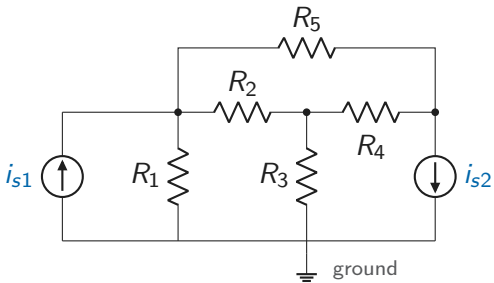

Step 1: choose a reference node

Reference node: the ground

Its node voltage: 0

Step 1: choose a reference node

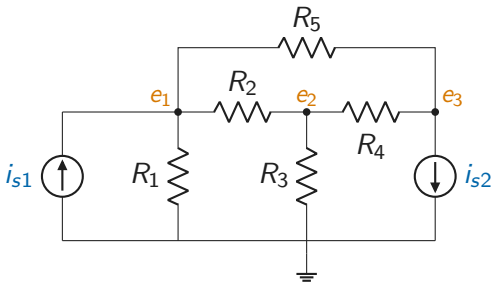

Reference node: the ground

Its node voltage: 0

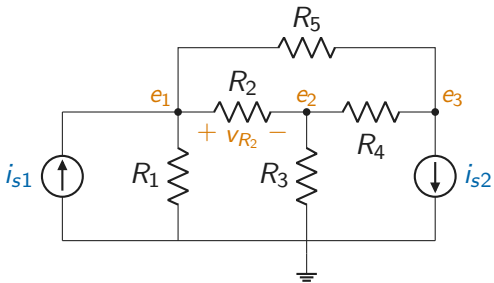

Any node can be the ground

Step 2: label the node voltages

Unknowns: e_1, e_2, e_3

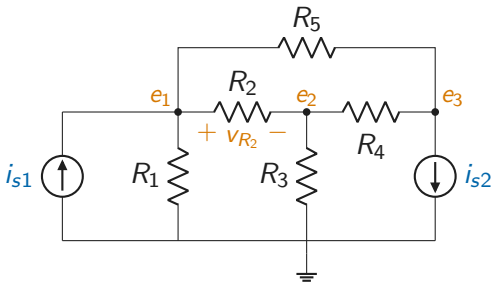

Step 2: label the node voltages

Unknowns: e_1, e_2, e_3

$v_{R_2} = e_1 - e_2$

Step 2: label the node voltages

Unknowns: e_1, e_2, e_3

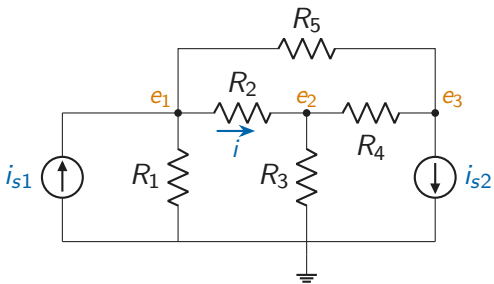

$v_{R_2} = e_1 - e_2$

KVL holds automatically:

$v_{R_1} = v_{R_2} + v_{R_3}$

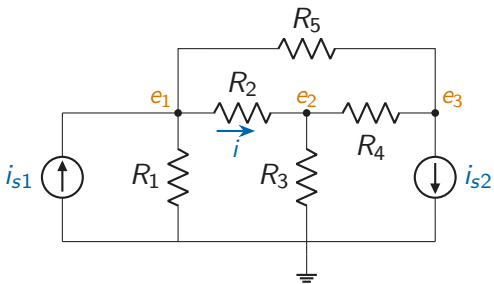

$e_1 = (e_1 - e_2) + e_2$

Step 3: write the currents with node voltages

Question. i leaving node 1 through R_2?

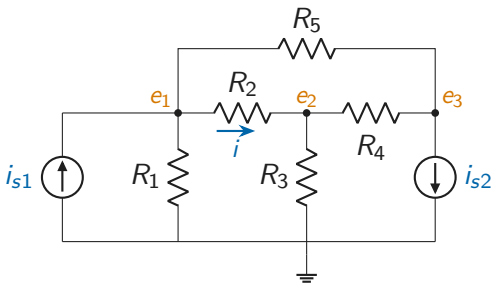

Step 3: write the currents with node voltages

Question. i leaving node 1 through R_2?

$$i = \frac{e_1 - e_2}{R_2}$$

Step 3: write the currents with node voltages

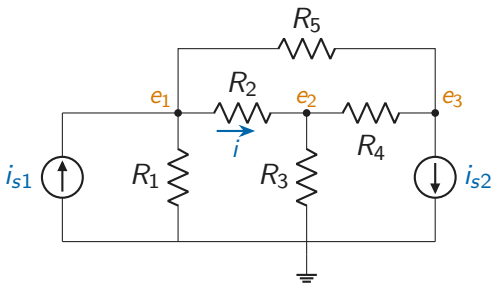

Question. i leaving node 1 through R_2?

$$i = \frac{e_1 - e_2}{R_2}$$

Through R_1: $\dfrac{e_1}{R_1}$

Step 3: write the currents with node voltages

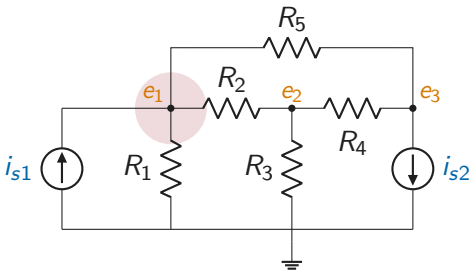

Question. i leaving node 1 through R_2?

$$i = \frac{e_1 - e_2}{R_2}$$

$$\boxed{\frac{\text{own} - \text{other}}{R}}$$

Node 2:

$$\frac{e_2 - e_1}{R_2} + \frac{e_2}{R_3} + \frac{e_2 - e_3}{R_4} = 0$$

Step 4: KCL at every node except the ground

Node 1:

$$-i_{s1} + \frac{e_1}{R_1} + \frac{e_1 - e_2}{R_2} + \frac{e_1 - e_3}{R_5} = 0$$

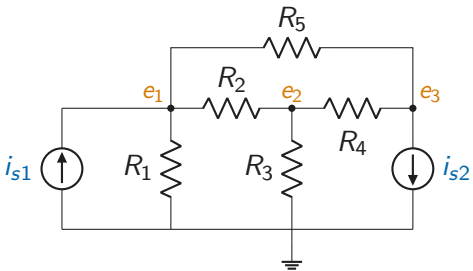

Node 2:

$$\frac{e_2 - e_1}{R_2} + \frac{e_2}{R_3} + \frac{e_2 - e_3}{R_4} = 0$$

Node 3:

$$\frac{e_3 - e_2}{R_4} + \frac{e_3 - e_1}{R_5} + i_{s2} = 0$$

Step 4: KCL at every node except the ground

Node 2: $\dfrac{e_2 - e_1}{2} + \dfrac{e_2}{4} = 0$

$$\begin{bmatrix} \frac{3}{2} & -\frac{1}{2} \\ -\frac{1}{2} & \frac{3}{4} \end{bmatrix} \begin{bmatrix} e_1 \\ e_2 \end{bmatrix} = \begin{bmatrix} 7 \\ 0 \end{bmatrix} \Rightarrow \begin{matrix} e_1 = 6\,\text{V} \\ e_2 = 4\,\text{V} \end{matrix}$$

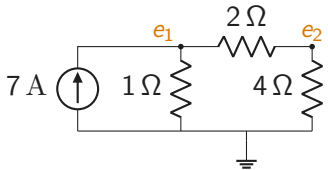

Node 1: $-7 + \dfrac{e_1' - e_3'}{1} + \dfrac{e_1'}{2} = 0$

Node 3: $7 + \dfrac{e_3' - e_1'}{1} + \dfrac{e_3'}{4} = 0$

$$\begin{bmatrix} \frac{3}{2} & -1 \\ -1 & \frac{5}{4} \end{bmatrix} \begin{bmatrix} e_1' \\ e_3' \end{bmatrix} = \begin{bmatrix} 7 \\ -7 \end{bmatrix} \Rightarrow \begin{matrix} e_1' = 2\,\text{V} \\ e_3' = -4\,\text{V} \end{matrix}$$

Branch voltages and currents do not change

Summary

In the circuit	What to do
resistors, current sources	$Y_n \mathbf{e} = \mathbf{i}_n$, by the rules; symmetric
voltage source to the ground	e_k known; no KCL at node k
voltage source between nodes	Method I or supernode, plus constraint
dependent source	control in node voltages: constraint
choice of ground	any node; branch values do not change

Then $\mathbf{v} = A^T \mathbf{e}$ and the element laws
